

# M4i.77xx-x8 - 32 Channel Digital Waveform Acquisition

- Up to 720 MBit/s sampling rate in timing analysis mode
- Up to 700 MBit/s DDR sampling rate in state clock mode (clock gaps allowed)
- Differential interface version (for LVDS, (LV)PECL, (N)ECL and other differential signals)
- Programmable clock delay
- Single-ended interface version for logic levels 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5.0V
- Ultra Fast PCI Express x8 Gen 2 interface
- 4 GByte on-board memory (up to 1 GBit per channel)
- FIFO mode continuous streaming
- Modes: Single-Shot, Multiple Recording, Gated Sampling, Timestamp
- Trigger input/output with AND/OR functionality
- Synchronization of up to 8 cards per system

- PCle x8 Gen 2 Interface
- Works with x8/x16\* PCle slots
- Sustained streaming mode more than 3.4 GB/s

#### **Operating Systems**

- Windows XP, Vista, 7, 8, 10
- Linux Kernel 2.6, 3.x, 4.x
- Windows/Linux 32 and 64 bit

### Recomended Software

- Visual Basic, Visual C++, Borland C++, GNU C++, Borland Delphi, VB.NET, C#, J#, Python
- SBench 6

#### **Drivers**

- MATLAB
- LabVIEW
- LabWindows/CVI

Model	Interface	Channels	Sampling Clock	State Clock
M4i.7710-x8		32	125 MBit/s	125 MBit/s
M4i.7720-x8	Single-Ended	32	250 MBit/s	250 MBit/s
M4i.7730-x8		32	720 MBit/s	700 MBit/s
M4i.7725-x8	differential	32	250 MBit/s	250 MBit/s
M4i.7735-x8	differential	32	720 MBit/s	700 MBit/s

### **General Information**

The M4i.77xx-x8 series digital waveform acquisition (logic-analyzer) cards include versions with 32 synchronous channels, either single-ended with programmable threshold levels or differential. The large on-board memory can be segmented to record different waveform sequences.

The cards feature a PCI Express x8 Gen 2 interface that offers outstanding data streaming performance. The interface and Spectrum's optimized drivers enable data transfer rates in excess of 3.0 GByte/s (24 GBit/s) so that all channels can continuously be recorded, even at full sample rate.

While the M4i.77xx cards have been designed using the latest technology they are still software compatible with the drivers from earlier Spectrum digital acquisition cards. Therefore existing customers can use the same software they developed for a 10 year old 60 MS/s digital input card also for an M4i.77xx series 720 MS/s logic analyzer.

<sup>\*</sup>Some x16 PCle slots are for the use of graphic cards only and can not be used for other cards. Throughput measured with a motherboard chipset supporting a TLP size of 256 bytes.

## **Software Support**

#### Windows drivers

The cards are delivered with drivers for Windows XP, as well as Vista, Windows 7, Windows 8 and Windows 10 (each 32 bit and 64 bit). Programming examples for Visual C++, Borland C++ Builder, LabWindows/CVI, Borland Delphi, Visual Basic, VB.NET, C#, J#, Python and IVI are included.

#### **Linux Drivers**

All cards are delivered with full Linux support. Pre compiled kernel modules are included for the most common distributions like RedHat, Fedora, Suse, Ubuntu LTS or Debian. The Linux support includes SMP systems, 32 bit and 64 bit systems, versatile programming examples for Gnu

C++ as well as the possibility to get the driver sources for your own compilation.

#### SBench 6

A base license of SBench 6, the easyto-use graphical operating software for Spectrum cards, is included in the delivery. The base license makes it is possible to test the card, generate simple signals or load and replay previously stored SBench 6 signals. It's a valuable tool for checking the cards performance and assisting

with the units initial setup. The cards also come with a demo license for the SBenchó professional version. This license gives the user the opportunity to test the additional features of the professional version with their hardware. The professional version contains several advanced measurement functions, such as FFTs and X/Y display, import and export utilities as well as support for all replay modes including data streaming. Data streaming allows the cards to continuously replay data and transfer it directly from the PC RAM or hard disk. SBench 6 has been optimized to handle data files of several GBytes. SBench 6 runs under Windows as well as Linux (KDE and GNOME) operating systems. A test version of SBench 6 can be downloaded directly over the internet and can run the professional version in a simulation mode without any hardware installed. Existing customers can also request a demo license for the professional version from Spectrum. More details on SBench 6 can be found in the SBench 6 data sheet.

### **Third-party products**

Spectrum supports the most popular third-party software products such as LabVIEW, MATLAB or LabWindows/CVI. All drivers come with detailed documentation and working examples are included in the delivery. Support for other software packages, like VEE or DasyLab, can also be provided on request.

### **Hardware features and options**

### PCI Express x8

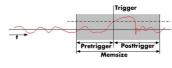

The M4i series cards use a PCI Express x8 Gen 2 connection. They can be used in PCI Express x8 and x16 slots with Gen 1, Gen 2 or Gen 3. The maximum sustained data transfer rate is more than 3.3

GByte/s (read direction) or 2.8 GByte/s (write direction) per slot. Server motherboards often recognize PCI Express x4 connections in x8 slots. These slots can also be used with the M4i series cards but with reduced data transfer rates.

#### **Connections**

- The cards are equipped with two VHDCI connectors for the digital channels as well as for the external trigger, clock input and clock output. These connectors also provide two seperate multi-function inputs as well as multi-function outputs that can be individually programmed to perform different functions:
- Trigger output
- Status output (armed, triggered, ready, ...)
- Asynchronous I/O lines

### Ring buffer mode

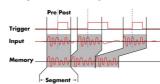

The ring buffer mode is the standard mode of all oscilloscope instruments. Digitized data is continuously written into a ring memory until a

trigger event is detected. After the trigger, post-trigger samples are recorded and pre-trigger samples can also be stored. The number of pre-trigger samples available simply equals the total ring memory size minus the number of post trigger samples.

#### **FIFO** mode

The FIFO or streaming mode is designed for continuous data transfer between the digitizer card and the PC memory. When mounted in a PCI Express x8 Gen 2 interface read streaming speeds of up to 3.4 GByte/s are possible. The control of the data stream is done automatically by the driver on interrupt request basis. The complete installed onboard memory is used to buffer the data, making the continuous streaming process extremely reliable.

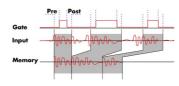

#### **Multiple Recording**

The Multiple Recording mode allows the recording of several trigger events with an extremely short re-arming time. The hardware doesn't need to be restarted in be-

tween. The on-board memory is divided in several segments of the same size. Each of them is filled with data if a trigger event occurs. Pre- and posttrigger of the segments can be programmed. The number of acquired segments is only limited by the used memory and is unlimited when using FIFO mode.

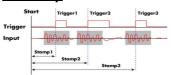

### **Gated Sampling**

The Gated Sampling mode allows data recording controlled by an external gate signal. Data is only recorded if the gate signal has a programmed level. In addition a pre-area before start

of the gate signal as well as a post area after end of the gate signal can be acquired. The number of gate segments is only limited by the used memory and is unlimited when using FIFO mode.

### **Timestamp**

The timestamp function writes the time positions of the trigger events in an extra memory. The timestamps are relative to the start of recording, a defined zero time, ex-

ternally synchronised to a radio clock, an IRIG-B a GPS receiver.

Using the external synchronization gives a precise time relation for acquisitions of systems on different locations.

#### Pattern trigger

Pattern triggers can be defined for every bit of the digital input data. Each input for the pattern trigger can be set to high or low, depending on the expected level, or "don't care". In addition, edge detection can be used to allow triggering on rising, falling or both edges. The pattern trigger can be used to recognize a huge variety of trigger events.

### **External trigger input**

The boards can be triggered using an external trigger input, that has the same exact interface capabilities as the installed data lines, either single-ended with programmable threshold or differential.

#### **External clock input and output**

Using a dedicated input line, that has the same exact interface capabilities as the installed data lines (either single-ended with programmable threshold or differential) a sampling clock can be fed in from an external system. Additionally it's also possible to output the internally used sampling clock on a separate line to synchronize external equipment to this clock.

### State clock

The state analysis mode allows to use an external clock to synchronously sample the applied data. In this mode the clock is allowed to have gaps, as long as the minimum required high and low times are met. To simplify the synchronous sampling of the data, the incoming clock signal can be shifted/delayed with regards to the data, to allow proper data capture.

#### Reference clock

The option to use a precise external reference clock (normally 10 MHz) is necessary to synchronize the instrument for high-quality

measurements with external equipment (like a signal source). It's also possible to enhance the quality of the sampling clock in this way. The driver automatically generates the requested sampling clock from the fed in reference clock.

### Star-Hub

The Star-Hub is an additional module allowing the phase stable synchronization of up to 8 boards of a kind in one system. Independent of the number of boards there is no phase delay between all channels. The Star-Hub distributes trigger and clock information between all boards to ensure all connected boards are running with the same clock and trigger. All trigger

sources can be combined with a logical OR allowing all channels of all cards to be the trigger source at the same time.

### **Technical Data**

### **Differential Interface**

Available inputs Data D0 to D31, Trigger (TrigIn), Strobe, Clock (ClkIn), X0, X1

32 channels, 16 channels, 8 channels Data Channel Selection software programmable

LVDS, LVPECL, PECL, (N)ECL, universal differential inputs Data/Control Input Compatibility

The card is delivered with 4 GByte on-board memory and supports standard acquisition (Scope), FIFO acquisition (streaming), Multiple Recording, Gated Sampling and Timestamps. Operating system drivers for Windows/Linux 32 bit and 64 bit, examples for C/C++, LabVIEW (Windows), MATLAB (Windows and Linux), LabWindows/CVI, .NET, Delphi, Visual Basic, Python and a Base license of the oscilloscope/logic-analyzer software SBench 6 are included. Drivers for other 3rd party products like VEE or DASYLab may be available

#### Adapter cables are not included. Please order separately!
